Aprendizagem - Machine Learning
Homework 2
Deadline 9/10/2024 20:00
Submit on Fenix as pdf

I) Bayesian Classifier (8 pts)

Given a data set describing a sample

x ₁	x ₂	Class

0.5	0.5	A
1	1.5	A
1.5	0.8	A
2	1.8	A
2	0	B
2	1	B
3	0	B
5	1.2	B

And the query vector $x = (x_1, x_2)^T = (1, 2)^T$

- a) (3pts) Compute the most probable class for the query vector, under the Naive Bayes assumption, using 1-dimensional Gaussians to model the likelihoods. (Hint, the likelihood is described of each class is described by two Gaussians (Normal Distributions, each distribution is defined by a mean value and standard deviation..)
- b) (3 pts) Compute the most probable class for the query vector assuming that the likelihoods are 2-dimensional Gaussians.
- c) (1 pts) Given a data set

x ₃	Class

0	A
1	A
1	A
0	A
1	B
1	B
0	B
1	B

And the query vector $x_3 = \text{True} = 1$

Compute the most probable class, with x3 being a categorical class 1=True, 0=False.

d) (1pts) Given a data set describing a sample combining the data set before

x ₁	x ₂	x ₃	Class

0.5	0.5	0	A
1	1.5	1	A
1.5	0.8	1	A
2	1.8	0	A
2	0	1	B
2	1	1	B
3	0	0	B
5	1.2	1	B

x₁ and x₂ are dependable and x₃ is independent of x₁ and x₂. x₃ is a categorical class.
And the query vector $x = (1, 2, 1)^T$ Compute the most probable class and indicate the estimated relative probability.

Hint,

$$p(A, x_{\text{query}}) = p((1, 2)|A) \cdot P(1|A) \cdot p(A)$$

$$p(B, x_{\text{query}}) = p((1, 2)|B) \cdot P(1|B) \cdot p(B)$$

you have already computed the values in b) and in c)

$$P(1|A) = \text{card}(A.1)/\text{card}(A) = 2/4$$

$$P(1|B) = \text{card}(A.1)/\text{card}(B) = 3/4$$

III Software Experiments (2pts)

Download the jupyter notebook HM2_kB.ipynb.

Split the data using the command (in the notebook)

```
digits = datasets.load_digits()  
X, y = digits.data, digits.target  
X_train, X_test, y_train, y_test = train_test_split(X, y, train_size=0.7, stratify=y, random_state=your_group_number)
```

And do the experiments with kNN with k=1, k=3, and GaussNB as indicated in the file and indicate the accuracy results.

Load the wine data set wine = datasets.load_wine() and redo the experiments, indicate the new accuracy values.

Which method gives better result for which data set? Do you know why? Pls indicate in one sentence.
